

EXECUTIVE SUMMARY

Tidewater Dental is running a 22-person, three-location practice on a mix of legacy Windows Server, ad-hoc cloud backups, and shared admin passwords. The infrastructure works day-to-day, but HIPAA exposure is high, recovery from a ransomware event would take 5+ days, and the practice has no formal offboarding for departing staff. The fixes are mostly off-the-shelf — about six weeks of focused work to move from at-risk to healthy.

OVERALL POSTURE: AT RISK

SCORECARD

DOMAIN	STATUS	ONE-LINE READ
Cybersecurity & Compliance	RED	No MFA on email or PMS; shared admin password across 3 sites; no documented HIPAA controls.
Cloud & Infrastructure	AMBER	M365 in use but tenant settings default-permissive; one on-prem server past EOL.
Backup & Disaster Recovery	RED	Backups exist but have never been test-restored; RTO unknown; no offsite copy.
Identity & Access Management	RED	Four shared logins; no offboarding checklist; ex-staff still in PMS.
Applications & SaaS Footprint	AMBER	14 SaaS tools billed, ~5 actively used; no central inventory.
IT Operations & Support	AMBER	Help routes through office manager; no ticketing; response times not tracked.

Red = active risk, fix within 30 days · Amber = degraded, fix within 90 · Green = healthy

TOP FINDINGS

- 01. No MFA on email or PMS CRITICAL**

A single phished credential currently grants attacker access to patient records and email. Highest-probability incident path and the cheapest to close.
- 02. Backups never test-restored CRITICAL**

If a ransomware event happened tomorrow, the practice has no proof its backups would actually restore. A test restore is a one-day exercise.
- 03. Shared admin accounts across 3 sites HIGH**

Auditability is zero — when something changes, there is no record of who did it. Also a HIPAA finding if audited.
- 04. EOL Windows Server hosting imaging share HIGH**

No security patches since EOL date; one CVE away from forced downtime. Migration to Azure file shares is a two-week project.
- 05. SaaS sprawl — 9 of 14 tools unused MEDIUM**

~\$1,400/mo in waste; each unused tool is also a credential set someone needs to remember. Quick audit clears both problems.

RECOMMENDED NEXT 90 DAYS

THIS WEEK — QUICK WINS	NEXT 30 DAYS	60-90 DAYS
→ Turn on MFA across M365 and the practice management system	→ Run a backup test-restore and document the RTO	→ Migrate imaging share off EOL Windows Server to Azure file shares
→ Rotate shared admin credentials and create named admin accounts	→ Build an offboarding checklist; remove ex-staff from all systems	→ Document HIPAA technical controls (encryption, access logging, audit trail)
	→ Audit and cancel unused SaaS subscriptions	→ Stand up a help ticketing channel so response times are measurable

YOUR NEXT STEP

This 1-pager is the diagnostic. The next step is a 45-minute scoping call where we turn it into a costed roadmap with start dates and the Preston East tier that fits.

For Tidewater Dental, the cluster of HIPAA, multi-site, and 22 employees points to the *Growth* tier (\$2,997/mo + \$2,500 setup) as the natural fit, but we'll confirm on the call.
